BUSINESS AUTOMATION · LOCAL GOVERNMENT SYSTEMS

October 28, 2026

The Honorable _____
Punong Barangay

Barangay Poblacion

Malasiqui, Pangasinan

Dear Captain _____,

Subject: Proposal — eBarangay Portal for Barangay Poblacion

We respectfully submit for your consideration the **eBarangay Portal**: a complete electronic records and services system built for a barangay, and for a barangay alone.

The barangay issues the document most residents need in a given year — a clearance, a certificate of residency, a certificate of indigency — and it does so from a hall two streets away. What it does not have is any way to prove, afterwards, that the paper it handed over is the paper it actually issued. A clearance is retyped, a date is changed, and nothing in the barangay can tell. **Every certificate this system releases carries a QR code** that opens a public page showing what your office recorded: the type, the reference, whose it is, when it was issued and what it is valid until. The bank, the employer or the school checking it needs no account and installs nothing.

It also carries the two books the Local Government Code asks a barangay to keep. The **Record of Barangay Inhabitants** is kept as a register that counts itself — population, households, age bands, per purok — so the figures a barangay is asked for are answered from the book rather than recompiled by hand, and a household with no date of birth on it is reported rather than quietly dropped from the count. The **Katarungang Pambarangay blotter** records a matter, the summons that call both sides, whether each one was actually served, and how it ended. Both stay inside this barangay: the municipality cannot read them, no other barangay can, and neither can any resident.

The notice board is the part your residents will notice first. A sheet of paper taped outside the hall reaches whoever walks past it that week; the same notice posted here reaches every resident who has the app on their phone, and one marked urgent rings them. Nothing else in the system does that, deliberately — an app where any clerk can ring every phone in the barangay is an app whose notifications get switched off, and then the one that mattered goes unread.

And it is the barangay half of a system that also runs a municipal hall. If the Municipality of Malasiqui later adopts the eLGU Citizen Portal, this barangay joins it as a setting rather than a migration — the same software, the same records, nothing re-entered. That is not a promise about a future version; it is the reason the system is built the way it is.

It is built and working today, with more than 1,600 automated checks running against a live database, and the pages that follow list every control in each of the four portals so you can see exactly what it does. **We would be glad to demonstrate it to you and your Secretary at the hall, at no cost and with no obligation.**

Thank you for your time and for your service to Barangay Poblacion.

Respectfully yours,

JOHN CARLO E. MORALES

FMCM IT SOLUTIONS

eBarangay Portal

One system serves four portals: an app for residents of Barangay Poblacion, a console for the hall, a read-only view for the Sangguniang Barangay, and a public certificate check that needs no account at all.

A certificate that can be checked

Every clearance, residency and indigency certificate comes out as a real PDF carrying your seal, the Punong Barangay's and the Secretary's signatures, and a QR. A bank or an employer scans it and sees what your office recorded — no account, no app.

The board, on every phone

A notice taped outside the hall works for whoever walks past it that week. The same notice here reaches every resident who has the app, and an urgent one rings their phone.

The books the law asks you to keep

The Record of Barangay Inhabitants and the Katarungang Pambarangay blotter, with the summons it issues — kept as records rather than as a filing cabinet, and nothing readable outside this barangay.

Your records stay yours

The blotter and the household register are reachable from this barangay's own console and nowhere else — not by the municipality, not by another barangay, not by any resident, and not by your own councillors.

THE FOUR PORTALS	CONTROLS
Resident app	33
Barangay console	37
Council view	7
Public certificate check	6

What we would need from your office. The certificates you issue and what you charge for each; your hall's address, hours and a number residents can ring; the names of the Punong Barangay and the Barangay Secretary; your barangay seal and the two signatures as scans; and the wording your own forms use on each certificate. Everything after that is set in the console by your administrator — no developer is needed to change a fee, correct a phone number or issue a clerk an account.

What it does not do, said plainly. No fee is paid online: the barangay takes its money at the hall on collection, exactly as it does now, and the system quotes the amount rather than collecting it. A signature on a certificate is a scan of a real one — it makes the paper look right and proves nothing by itself, which is what the QR code is for. Email and SMS need a mail and messaging service to be connected before they reach anybody. And nothing in the system checks what a certificate attests: a clearance says the holder has no pending case because the office releasing it says so.

1 Resident app

Who uses it. Anybody living in the barangay. They register themselves; nobody at the hall types them in.

A mobile-first app that installs to the home screen. Three items in the bottom bar — the municipal portal's two extra tabs are the hall's, and a barangay deployment does not pretend to have them.

The bottom bar

Three destinations, always on screen. There is one government here, so there is no tier to choose and no switch to get wrong.

- **Home**
  The dashboard: digital ID, the emergency button, and the one door into the barangay.
- **Services**
  The barangay hub — notices first, then what the barangay issues, then what you have asked for.
- **Profile**
  The ID, data rights, help, language and text size.

Home

The emergency button is the only red control on the screen. A resident who needs it is not reading — they are looking for the one thing that is obviously it.

- **Notifications**
  Everything the barangay has told this resident, with an unread count on the bell.
- **Emergency hotlines**
  Opens the numbers. It never dials by itself — an app that places a call on a tap is one that rings the fire brigade from a pocket.
- **Your barangay**
  The single door. It names the barangay rather than offering a choice there is only one answer to.
- **Digital ID card**
  Tap the card to open the full ID.
- **Install this app**
  A dismissible banner, shown only where the browser says installing is actually possible.

The barangay hub

The notice board sits above the certificates: what the barangay is telling you comes before what you can ask it for.

- **Notices**
  The board outside the hall, on the phone. Urgent ones carry a word and an icon in amber — never colour alone.
- **Request a certificate**
  One purpose field, because that is what a barangay certificate actually asks for.
- **My barangay requests**
  Everything asked for, with where each one has got to.
- **Valid until**
  Stamped when the barangay marks it ready, so the app says what the paper says. A lapsed one says so in words and asks for a fresh one.
- **The hall**
  Address, hours, the captain, the secretary and a number to ring — repeated on the "ready" row, so nobody travels to a closed hall.
- **Download certificate**
  Available once released — the barangay takes its fee at the hall on collection.

The digital ID

There is no national-ID integration and the app does not imply one. What proves this card is its own code, which the barangay checks.

- **The card face**
  Name, barangay, date of birth and the portrait. It is headed eBarangay Digital ID, not somebody else's system.
- **Show verification code**
  Lives 90 seconds and is spent the first time a clerk checks it, so a screenshot is stale before it reaches a window.
- **New code**
  Issuing one retires any still outstanding, so a code left open in another tab is not a second key.
- **Take a selfie / choose a photo**
  Cropped square and scaled before upload. Only the resident can ever read it back.
- **Remove photo**
  Takes the portrait off the ID.
- **Emergency numbers on the ID**
  Cached on the device, because somebody needing one is very often somewhere with no signal.

Profile and the rights screens

Reached from Profile rather than the bottom bar — these are screens you go looking for, not ones you pass through.

- **Digital ID & verification code**
  Opens the full ID.
- **My data**
  Export, correct and close — the three RA 10173 rights as buttons.
- **Privacy notice**
  What is held, and who the Data Protection Officer is.
- **Help & support**
  How to reach the barangay.
- **English / Filipino**
  Switches the whole app, including dates and durations.
- **Text size**
  Normal, Large, Largest. Each option renders at the size it selects — which matters in a barangay with seniors in it.
- **Push notifications**
  Only rendered where push is actually configured — a toggle that cannot work is worse than none.
- **Install the app**
  Never dismissed here, and confirms "Installed" once it is.
- **Sign out**
  Clears the session on this device.

My data — the three rights

Erasure is the right the system cannot grant in full, and it says so before anything happens rather than afterwards.

- **Export my data**
  One file: the profile, every certificate request and its history, attachments listed, notifications, ID checks and the devices set to notify them.
- **Correct my details**
  Address and phone — facts the resident knows better than the office. A name is an identity claim and goes through the Civil Registrar; the screen says so rather than leaving a dead field.
- **See what closing would do**
  Names what would be deleted and what would be kept, with the reason, before anything happens.
- **Close my account**
  Closes the sign-in, erases contact details and the portrait, and releases the email address.

2 Barangay console

Who uses it. The Punong Barangay or the Secretary as administrator, and the barangay's own clerks.

A desk-width console. Which tabs render depends on the account — and the server refuses the rest regardless. The hidden tab is the courtesy; the refusal is the control.

The tabs

The first five are both roles'. The last three are the administrator's: what the barangay charges, who works there, and what it has done.

Requests
The certificate queue: pending, processing, ready, released, rejected.

Notices
The board of notices residents see on their phones.

Blotter
Katarungang Pambarangay: the book a dispute is written in, and the summons that call both sides.

Households
The Record of Barangay Inhabitants — who lives where, and the counts the barangay plans from.

The hall
Captain, secretary, address, hours, phone, seal and the two signatures. Both roles read; only the administrator writes.

Summary
Administrator only. What the office issued and collected.

Certificates
Administrator only. What the barangay issues and what it charges for each.

Officers
Administrator only. Issue the barangay's own clerks and kagawads — but never another administrator.

Moving a certificate

The order is enforced on the server, not merely rendered: "ready" means come and collect it, and a resident told that too early makes a wasted trip.

Processing
The secretary has taken the certificate up. The resident is told in the same transaction.

Ready
Prepared and dated. This is where the validity period is stamped — so a resident who collects three weeks later holds a certificate three weeks into its life, exactly as the paper says.

Released
Handed over, fee taken at the hall. This is where the PDF is written, with the seal and both signatures.

Reject
Requires a reason the resident can read.

Download certificate
The stored PDF — frozen at issue, so an election never reprints it over somebody else's name.

Withdraw
Administrator only, and it needs a reason. Both roles hand a certificate over; taking the barangay's word back is a decision.

Reissue
Administrator only. Mints a replacement carrying the same valid-until as the one it replaces — correcting a mistake is not renewing.

The board of notices

Everything else in this console refuses to be readable; this one inverts all of it. A notice is worth nothing until the people it concerns have seen it.

Post a notice
Title, body, optional expiry. Appears on every resident's phone, and comes off the board by itself on the day it lapses.

Mark urgent
Administrator only. Rings every resident of the barangay, written in the same transaction as the notice.

Reached N residents
The confirmation waits to be dismissed — the one screen stating the blast radius of what somebody just did should not vanish on a timer.

Edit
Allowed, and the board then says "edited". Urgency is not editable: the notification went or it did not.

Take down
Administrator only. Keeps the row in the archive — what the barangay said last month is a thing somebody asks about.

Blotter and summons

The most defamatory data a barangay holds. No resident route reads it, it is not in the privacy export, and the council cannot see it at all.

Record a matter
Complainant, respondent, contacts, nature, narrative — all free text, never linked to accounts, exactly as the paper book does it.

Search the book
Searching names, bounded to this barangay.

Issue a summons
Administrator only — it goes out over the Punong Barangay's name and compels two people to appear on a date.

Send the reminder
Carries who is asking, when, where and the reference — never the narrative and never the other party's name, because a lock screen is not private. It says in those words that it is not service.

Record service
Kept apart from the outcome: a respondent who never received the summons did not fail to appear.

Record what happened
Administrator only. One pending calling at a time, because two open summons are two dates and only one is right.

Close the matter
Final, cancels any outstanding hearing, and must say how it ended.

The register of inhabitants

The Local Government Code makes the Secretary keep this, and it is what a barangay actually plans from: who to feed, who to evacuate, how many seniors live on which purok.

The figures
Population, households, age bands, per purok — computed over the active register on every read, so they are never stale.

Without a date of birth
Reported rather than hidden: counted in the population and in no age band. A feeding programme planned off a silently short count is the harm.

Add a household
The head becomes a member automatically — a register whose head is only a column cannot count its own population.

Add a member
Free text, never linked to an account. A link would hand a clerk a view onto every account in the municipality.

Edit a member
PWD and 4Ps ticks are labelled "(noted)" so a clerk's checkbox can never read as an entitlement at a counter.

Take out of the register
Administrator only, and needs a reason. Nothing is deleted — next year's figures have to be comparable with this year's.

The hall, and the barangay's own accounts

The barangay issues its own clerks and councillors, because nobody else knows who holds a barangay office this term.

Correct the hall's details
Captain, secretary, address, hours, phone, email — the facts that change at every barangay election, corrected here rather than by a developer.

Upload seal and signatures
The barangay's seal and the two officials' signatures, drawn onto every certificate from then on. There is no third slot.

Issue an officer or kagawad
Starts with an unusable password; the holder chooses their own from an emailed link, and the screen says whether it actually sent.

Revoke
Spends any outstanding invitation, because a live reset link is a way back in. The administrator's own row is out of reach here, which is what stops a captain and a secretary revoking each other.

3 Council view

Who uses it. A member of the Sangguniang Barangay.

Its own sign-in with its own gate, not a clerk with fewer tabs. Putting the council on the clerk's gate and carving it back out screen by screen would leave the blotter one forgotten check away from a councillor.

What a kagawad sees

The figures come from the same code as the Secretary's own screen, so the council and the clerk never quote different population numbers at each other.

- **Summary**
  What the office issued and collected.
- **Register figures**
  Population, age bands, households per purok — counts only, never a name.
- **The notice board**
  Exactly as residents see it.

What is withheld, and why

Read-only, and conservative in the right direction: widening this later is one screen; narrowing it after seven people have been using it is not.

- **No certificate queue**
  Individual residents and what they asked the barangay for.
- **No household names**
  The register as people rather than as counts.
- **No blotter, entirely**
  Handing seven elected politicians a searchable book of accusations against their own constituents is a political weapon, and nothing about holding the office requires it.
- **No writes at all**
  A notice goes out over the barangay's name, so posting stays with the captain and the clerk. A council seat is not a megaphone.

4 Public certificate check

Who uses it. Anybody holding a printout: a bank, an employer, a school, a clerk at the municipal hall. No account.

Every certificate carries a QR. Scanning it opens one page that says what the barangay actually recorded — no app to install, no login, nothing to set up at the other end.

The check

A check that needs a login is a check that does not happen. Nothing is disclosed that the holder of the paper does not already have in their hand.

Scan or type the code
The QR carries a link, not a bare code — every phone knows what to do with a URL and none of them know what to do with sixteen loose characters.

Valid
What it is, the reference, who holds it, when it was issued, what it is valid until, and the live status.

Lapsed
Amber, and in words. A real certificate that needs replacing, not a fake one — a counter acts differently on each.

Withdrawn
Red, and it says whether a replacement exists: the difference between "do not accept this" and "do not accept this, ask them for the current one".

Not found
A typo or a forgery. The codes are long and random, so the list cannot be walked.

Checked N times
The only trace a photocopy leaves, shown to the person deciding whether to accept the paper — they are the one who can act on it.
